## Report on the Basic Survey (Radiation Dose Estimates)

#### 1. Summary of Survey

#### 1.1 Purpose

In consideration of radiation effects of the Fukushima Daiichi Nuclear Power Plant accident caused by the Great East Japan Earthquake, we aim to estimate external exposure doses of Fukushima residents from their behavior records, and to inform them of the results for their future health management.

#### **1.2 Survey Population**

- (1) Those who were registered residents of Fukushima Prefecture from March 11 to July 1 2011.
- (2) Those who lived or stayed in Fukushima without being registered as residents and who commuted to Fukushima from outside for work, school, or other reasons (hereinafter, "Temporary Visitors"). Upon request from eligible persons, we would send Basic Survey questionnaires for their participation.

#### 2. Response Rates and Radiation Dose Estimates

#### 2.1 Response Rates of Residents

The overall response rate to the Basic Survey (radiation dose estimates), for the entire population of Fukushima Prefecture, was 27.7% (569,188 of 2,055,236) as of March 31, 2022.

Among the respondents, 75,250 (\*1) answered using the simplified questionnaire.

The number of responses received from April 1, 2021 to March 31, 2022 (FY2021) was 48 with the original questionnaire, and 297 with a simplified one.

Table 1 Response rate to the Basic Survey							
	As of M	arch 31, 2022					
Survey Population	2,055,236	Response Rate					
Original Questionnaire	493,938	24.0%					
Simplified questionnaire *1	75,250	3.7%					
Total Responses	569,188	27.7%					
Total Responses	569,188	27.7%					

\*1 The number of submissions using the simplified questionnaire could not be fixed yet, because we may need to ask some of the respondents who used the simplified questionnaire for resubmission using the original questionnaire, depending on the content of their simplified questionnaire.

Table 2 Response ra	ate by age gro	up					As of Ma	rch 31, 2022
Age group	Age 0-9	Age 10-19	Age 20-29	Age 30-39	Age 40-49	Age 50-59	Age 60 and over	Total
Response rate	46.7%	36.3%	18.2%	24.8%	22.5%	23.0%	27.9%	27.7%

Table 2 shows the response rate for each age group

#### 2.2 Radiation Dose Estimates

Out of 569,188 total responses, 555,067 is the number of valid responses, excluding incomplete or invalid answers that are insufficient to track movements or location history required for dose estimation (\*2). Among those, 554,929 have already been processed to complete their dose estimations, and result reports have been sent to 554,741 respondents (\*3).

Table 3 Resp	onse rate to th	ne Basic Surve	ey						
								As of M	March 31, 2022
Region	Survey population	Responses	Response rate	Valid responses	Valid response rate	Estimation completed	Estimation Rate	Sent	Notification rate
	а	b	c=b/a	d	e=d/a	f	g=f/d	h	i=h/d
Kenpoku	504,015	152,449	30.2%	149,527	29.7%	149,511	100.0%	149,459	100.0%
Kenchu	557,176	137,235	24.6%	134,134	24.1%	134,078	100.0%	134,066	99.9%
Kennan	152,225	35,618	23.4%	34,808	22.9%	34,788	99.9%	34,778	99.9%
Aizu	267,198	58,371	21.8%	56,170	21.0%	56,163	100.0%	56,154	100.0%
Minamiaizu	30,788	6,427	20.9%	6,120	19.9%	6,116	99.9%	6,115	99.9%
Soso	195,594	90,267	46.2%	87,557	44.8%	87,555	100.0%	87,463	99.9%
Iwaki	348,240	88,821	25.5%	86,751	24.9%	86,718	100.0%	86,706	99.9%
Total	2,055,236	569,188	27.7%	555,067	27.0%	554,929	100.0%	554,741	99.9%

\*The figures include responses from the area covered by the initial survey area. (Yamakiya district of Kawamata Town, Namie Town and litate Village) \*See appendix 1 for the results of each municipality.

\*Percentages are rounded to one decimal place.

(\*2) "Incomplete or invalid responses" are those in which additional information was necessary for dose estimation (by soliciting details of their behavior through a direct contact, etc.), but was not obtained because the respondents' contact information was not available or because respondents expressed their refusal to participate in the survey (including those informed through our Call Center).

(\*3) The number of responses, valid responses, dose estimates completed, and results returned in Table 3, 4, and Appendix 1 include data from the responses that did not contain behavior records for four full months after March 11, which is the period favored for dose estimation.

### 2.3 Response rate and dose estimation for temporary visitors

We have been estimating doses for non-residents who were visiting or staying in Fukushima Prefecture at the time of the accident (see Table 4)

Table 4 Repo	ort of tempora	ary visitors st	atus					
							As of Ma	arch 31, 2022
Survey	Responses	Response	Valid	Valid	Dose	Estimation	Sent	Notification
population		rate	responses	response	estimation	rate		rate
				rate	completed			
а	b	c=b/a	d	e=d/a	f	g=f/d	h	i=h/d
4,151	2,155	51.9%	2,145	51.7%	2,145	100.0%	2,145	100.0%

#### 3. Results of Radiation Dose Estimates

Table 5 shows a breakdown of completed dose estimates (from Table 3), excluding those from periods of less than four months. Radiation doses for a total of 476,189 residents have been estimated to date. The result for 466,972 respondents (excluding radiation workers) suggest that the result of dose estimation for about 87% of the respondents in Kenpoku and about 92% in Kenchu were <2 mSv. The doses for approximately 88% of the respondents in Kennan and more than 99% of those in Aizu and Minamiaizu were <1 mSv. Doses for about 77% of respondents in Soso and more than 99% of respondents in Iwaki were also <1 mSv.

. .

(\*5) Including the area covered by the initial survey (Namie Town and Iitate Village)

• Distribution of estimated external doses by area, by age group, by gender, and by municipality are shown in Appendix 2, 3-1, 3-2, and 4, respectively.

#### 4. Evaluation of the effective dose estimation results

The latest effective radiation dose estimates show similar trends to those observed so far in past years. Since previous epidemiological studies indicate no significant health effects at doses  $\leq 100 \text{ mSv}^{1}$ , we concluded that radiation doses estimated so far are unlikely to cause adverse effects on health, although this conclusion is based on external radiation doses estimated only for the first four months following the accident.

#### Reference

1) Sources and effects of ionizing radiation, United Nations Scientific Committee on the Effects of Atomic Radiation, UNSCEAR 2008 Report to the General Assembly, with scientific annexes vol 2.

### 5. Questionnaire Response Guidance

In FY2021, we held a total of 26 response guidance sessions at Thyroid Ultrasound Examination venues in 7 regions in the prefecture (the schedule was as follows).

First half of the year:	12 times between July 18, 2021 – August 17, 2021
Second half of the year:	14 times between December 19, 2021 - March 28, 2022

Contact opportunities continue for those who wish to know about their level of exposure. Reissuance of questionnaires can still be requested through the homepage of the Radiation Medical Science Center and the Call Center. In addition, information leaflets about the Basic Survey are available at municipal offices.

## Response rates to the Basic Survey by municipality

### Results of the Mental Health and Lifestyle Survey for FY2020

#### 1. Purpose

The Great East Japan Earthquake of March 11, 2011, the subsequent accident at the Fukushima Daiichi Nuclear Power Plant, and life under prolonged evacuation have caused great anxiety and psychological distress among Fukushima residents. Objectives of the Mental Health and Lifestyle Survey are to properly assess our residents' physical, psychological, and lifestyle conditions and to provide them with appropriate care along with social support. Based on the understanding gained from results of the Mental Health and Lifestyle Survey for FY2011-2019, we will continue watching for changes of mental health and lifestyle among residents, and offer care when necessary.

#### 2. Methods

#### (1) Eligible persons

- Those who were registered as residents in covered areas\* from March 11, 2011 to April 1, 2012 (including those who moved out from those areas)
- Those who were registered as residents of municipalities designated as evacuation zones as of April 1, 2020
- · Others, as warranted, based on Basic Survey results, even if the above conditions are not met

۲he total number of eligible persons: 199,461 (as of October 31, 2021)	
Ages 0–3 Survey: Those born from April 2, 2017 to April 1, 2020	2,767 people
Ages 4–6 Survey: Those born from April 2, 2014 to April 1, 2017	3,385 people
Elementary School Survey: Residents born from April 2, 2008 to April 1, 2014	8,678 people
Junior High School Survey: Residents born from April 2, 2005 to April 1, 2008	5,179 people
Adult Survey: Residents born on or before April 1, 2005	179,452 people

\* Covered areas: Municipalities that were designated as evacuation zones by the Japanese Government in 2011

Hirono Town, Naraha Town, Tomioka Town, Kawauchi Village, Okuma Town, Futaba town, Namie Town, Katsurao Village, Iitate Village, Minamisoma City, Tamura City, Kawamata Town, and parts of Date City (containing specific spots recommended for evacuation)

#### (2) Methods

#### A. Survey sheets

Survey sheets developed for each age group were mailed to eligible persons. The Adult Survey sheets were to be answered by the addressees themselves, and other survey sheets (Junior High School Survey and surveys for younger age groups) were to be answered by the parents/guardians of the addressees. The Junior High School Survey also contains questions to be answered by the addressees themselves.

#### **B. Mailing dates**

Survey sheets were mailed out staring January 28, 2021.

#### C. Method of answering

Responses were returned either by post or online.

(Online responses were accepted from the day when the survey sheets were delivered to March 31, 2021.)

#### (3) Data tabulation period

Responses received from the day when the FY2020 survey started to October 31, 2021 were tabulated.

#### 3. Summary of Survey Results

The results were tabulated for 5 age groups: Ages 0 - 3, Ages 4 - 6, Elementary School Students, Junior High School Students, and Adults. Due to some unreported items, the totals may not match the aforementioned valid responses. Percentages shown in this text and in tabulation results are rounded, and the total summing up those percentages may not be 100%. The details of the tabulation results are as shown in "6. Results of Tabulation of the FY2020 Mental Health and Lifestyle Survey."

## (1) Results of the Children's Surveys (Ages 0 – 3, Ages 4 – 6, Elementary School and Junior High School Surveys)

#### A. Number of respondents (and rates)

Total responses (and response rates) to the surveys of children (ages 0–3, ages 4–6, elementary school, and junior high school) are as shown in Table 1 and Figure 1

An online response system was newly introduced in FY2016. The percentages of online responses in FY2016 were 8.0% for those aged 0 to 3, 6.3% for those aged 4 to 6, 6.7% for elementary school students, and 8.0% for junior high school students, and the relevant percentages in FY2020 were 29.5%, 25.3%, 21.7%, and 21.1%, respectively.

Age group	Respondents	Response Rate	Valid responses	Response Rate
0-3	376	(13.6)	376	(13.6)
4-6	447	(13.2)	447	(13.2)
Elementary school students	1,273	(14.7)	1,265	(14.6)
Junior high school students	693	(13.4)	693	(13.4)
Total	2,789	(13.9)	2,781	(13.9)

Table 1. FY2020 Number of total responses and valid responses (response rates)

Figure 1. Changes in response rates for the children's surveys

#### **B. Frequency of daily exercise**

In the FY2020 survey, "Rarely" was the response among 0.9% in ages 2-3, 3.1% in ages 4-6, 36.0% in elementary school students, and 30.6% in junior high school students. In the FY2012 Survey, the percentages for preschool age groups, i.e., ages 2–3 and ages 4–6, were 26.7% and 15.0%, respectively, with steady improvement year by year since then (Figures 2 and 3). School age children also showed improvement since the FY2011 survey, when the percentages were 53.0% for elementary school students and 47.0% for junior high school students (Figures 4 and 5).

According to a national survey on school children conducted in FY2019 (\*1), the percentage of those who exercise for less than 60 minutes per week (excluding PE classes at school) was 7.6% among elementary school boys, 13.0% among elementary school girls, 7.5% among junior high school boys, and 19.7% among junior high school girls. Although the results cannot be directly compared with the results of our survey because of differences in attributes of the children covered, such as school year, it can be said that exercise habits of Fukushima children are still below national averages.

Figure 5. Changes in frequency of exercise: Junior high school students

#### C. Proportion of those scoring 16 points or higher on SDQ

## (assessment of children's emotions and behavior)

Children's emotions and behaviors were surveyed using the SDQ (Strengths and Difficulties Questionnaire, with a cutoff value of 16 based on previous studies). In FY2020, the proportion of children with high-risk scores (SDQ score of 16 or higher) showing certain problematic behavior was 7.0% for children aged 4 to 6, 9.0% for elementary school children, and 10.9% for junior high school students (Figure 6). Compared with the 9.5% with high-risk scores in a survey covering children who were not affected by the disaster, as reported in 2008 (\*2), the proportion of Fukushima children with high-risk scores was higher for all age groups in FY2011, especially among children aged 4 to 6 (24.4%). The percentage declined thereafter for all age groups and the FY2020 survey results showed improvements, with the percentage almost the same as that in the prior survey (Figure 6).

However, consideration should be given that many of the surveyed children up to elementary school age have not experienced the Great East Japan Earthquake. A comparison of boys and girls showed that highrisk scores were generally higher among boys than girls, consistent with the 2008 study (Figure 7–9). By residential location at the time of the survey (both in and outside the prefecture), the proportion of those with high-risk scores was higher among those living outside the prefecture than those living in the prefecture (Figure 10).

#### [About SDQ]

The SDQ consists of 25 question related to children's emotions and behaviors, which are to be answered by the child's parent/guardian according to what extent each question applies to the child's behavior over the past six months. Scores of 16 or higher are considered to be indicative of certain problematic behaviors that warrant expert support.

%2 Matsuishi T, et al. (2008) Scale properties of the Japanese version of the Strengths and Difficulties Questionnaire (SDQ): A study of infant and school children in community samples. Brain and Development. 30: 410-415.

#### Figure 6. Changes in the proportion of those scoring 16 points or higher in SDQ: all age groups

\*16 points: reference points from the previous study.

\*9.5% is the rate of those with SDQ scores of 16 points or higher in non-disaster-affected area (Matsuishi et al., 2008)

Figure 9. Changes in the proportion of those scoring 16 points or higher in SDQ: Junior high school students

# Figure 10. FY2020 Changes in proportion of those scoring 16 points or higher in SDQ, by the location of residence at the time of the survey

#### D. Influence on daily life due to the spread of COVID-19

In the FY2020 survey, those who responded that COVID-19 exerted influence on their daily life "To some extent" or "Significantly" accounted for 52.7% for those aged 0 to 3, 58.4% for those aged 4 to 6, 56.9% for elementary school students, 59.7% for junior high school students, and 64.0% for guardians of junior high school students. \* Those in older age groups were more affected by COVID-19 (Figure 11).

\*From parents'/guardians' standpoint of influence

Figure 11. FY2020 Influence on daily life by the COVID-19 pandemic

#### (2) Results of the Adults Survey (for Those Aged 16 or Older)

## A. Number of respondents (response rate)

The number of adult respondents (aged 16 or older) (response rate) was 35,840 people (20.0%), and the number of those who made valid responses (valid response rate) was 35,690 people (19.9%). Annual changes are as shown in Figure 12.

By age group, the number of respondents (response rate) was 5,037 people (11.0%) for those aged 16 to 39; 10,183 people (17.9%) for those aged 40 to 64; and 20,620 people (26.8%) for those aged 65 or older (Figure 13).

An online response system was newly introduced in FY2016, and the percentage of online responses was 4.2% in FY2016 but increased to 10.8% in FY2020.

Figure 12. Changes in the response rates in the Adults Survey

#### **B. Subjective health conditions**

Regarding their health condition, 25.6% answered "Very good" or "Good" in the FY2020 survey. Figure 14 shows yearly changes in responses concerning subjective health conditions. In FY2011, those who answered "Very good" or "Good" accounted for 17.8% and the percentage is increasing slightly year by year.

Conversely, the proportion of those who responded "Bad" or "Very bad" was 18.5% in FY2011 but declined to 13.3% in FY2020.

When looked at by age group, the proportion of those who answered "Bad" or "Very bad" in the FY2020 Survey increased with age: 15.7% in Age 65 or older, substantially higher than 5.8% in Age 39 or younger (Figure 15).

	□Very good	⊡Good	⊠Normal	■Bad	■Very bad	
2011	4.2 13.6		63.7		16.7	
2012	3.9 15.7		62.5		16.4	
2013	3.8 16.1		61.6		16.9	
2014	4.0 15.9		61.7		16.7	
2015	4.1		62.3		15.5	
2016	4.2 16.7		62.0		15.5	
2017	4.1 17.1		62.9		14.5	;
2018	4.5		62.0		13.9	Э
2019	4.9		61.6		12.	.7
2020	5.2 20.3		61.1		12	.2
C	)% 20%	40%	% 60	)%	80%	10

Figure 14. Changes in subjective health conditions

Figure 15. Subjective health conditions by age group in the FY2020 Adults Survey

#### **C. Sufficiency of sleep**

41.5% of the respondents answered "Sufficient" in the FY2020 survey. Figure 16 shows yearly changes in the proportion of sleep sufficiency. In FY2011, it was 33.3% and showed a gradual increase year by year. Conversely, the proportion of those who answered "Very insufficient" or "Greatly insufficient or couldn't get any sleep" decreased from 19.9% in FY2011 to 12.8% in FY2020. However, about 60% were still dissatisfied with their sleep.

Figure 16. Changes in the degree of sleep sufficiency in adults

#### **D. Frequency of exercise**

In FY2020 survey, 38.8% answered "Rarely" in frequency of exercise. Figure 17 shows yearly changes in frequency of exercise. In FY2011 survey, "Rarely" was the answer of about half of the respondents, so the frequency of exercise has gradually been increasing.

At the same time, the respondents who answered "Almost every day" or "2–4 times a week" was 44.4% in FY2020. In a national survey conducted in FY2019(\*3), the proportion of those who answered that they exercise twice or more per week was 40.6%. Although the results cannot be directly compared with the results of our survey because of differences in participants' attributes, such as age, it can be said that exercise habits of Fukushima residents were similar to the national average.

When looked at by residential location at the time of the survey, those living outside the prefecture tended to do exercises less frequently than those living in the prefecture in FY2020 survey. (Figure 18) <a href="https://www.mhlw.go.jp/bunya/kenkou/ke

Figure 17. Changes in the frequency of exercise in adults

#### Figure 18. Frequency of exercise by location of residence at the time of the survey (in Fukushima prefecture or other prefecture) in the FY2020 Adults Survey

#### E. Prevalence of smoking

In the FY2020 survey, the proportion of smokers was 21.4% among males and 5.6% among females, with an overall ratio of 13.1%. Figure 19 shows yearly changes in the proportion of smokers by gender, with a definite downward trend since FY2011, when the percentage was 33.2% among males and 10.5% among females.

However, it is still high, compared with the goal of 12% set out in "Healthy Japan 21 (Phase 2)."

Figure 19. Changes in prevalence of smoking, by gender

#### F. Proportion of those suspected of problematic drinking (CAGE score 2 points or higher)

Problematic drinking behaviors were examined using the CAGE questionnaire (with a cutoff value of 2 points, based on previous studies). In the FY2020 survey, the proportion of those with high-risk scores (CAGE score of 2 points or higher) was 15.3% among males and 8.0% among females. Figure 20 shows yearly changes, indicating a downward trend for both genders since FY2012, when the proportion was 20.5% among males and 10.5% among females. By age group, the percentage was highest among those aged 40 to 64 (Figure 21). When compared by residential location at the time of the survey (in or outside the prefecture), the percentage was slightly higher among those living outside the prefecture for females (Figure 22).

#### [About CAGE]

The CAGE questionnaire consists of 4 questions about drinking behaviors over the past 30 days, with "yes" (1) or "no" (0) answers. Those scoring 2 points or higher are considered as likely to have a drinking problem.

Figure 21. Proportion of those disclosing evidence of problematic drinking (2 points or higher in CAGE) in the FY2020 Survey, by age

Figure 22. Proportion of those disclosing evidence of problematic drinking (2 points or higher in CAGE) in the FY2020 Survey, by residential location and by gender

#### G. Proportion of those judged to be in need of support for depression or anxiety

General mental health and the possibility of mood disorder (depression) and anxiety disorder were examined using the K6 Distress Scale (with a cutoff value of 13, based on previous studies). In the FY2020 survey, the proportion of those with high-risk scores (K6 score of 13 points or higher) for mood disorder or anxiety disorder was 5.2% overall. Figure 23 shows yearly changes in K6 results. In FY2011, the proportion of those with high-risk scores was quite high, at 14.6%, but declined substantially through FY2014 and has declined moderately since then to the present. However, the percentage is still high in Fukushima compared to a result of 3% shown in a previous study covering the general public who were not affected by the disaster. (\*4)

By gender, the percentage was higher among females (5.6%) than males (4.7%), consistent with results of the aforementioned previous study (Figure 24). The comparison by age group showed that the percentage was higher among young people than among older people; this does not concur with results of the prior study nor the levels of traumatic reaction, as explained later (Figure 25).

The comparison by residential location at the time of the survey (in or outside of Fukushima prefecture) showed that 7.6% of those living outside the prefecture were at high risk, versus 4.8% of those living in the prefecture (Figure 26).

#### [About K6]

The K6 Distress Scale consists of 6 questions about how often feelings and behaviors related to depression and anxiety occurred during the past 30 days. A score of is 13 or more is considered to indicate a possible mood or anxiety disorder.

\*4 Norito Kawakami. Distribution of mental health status and its related factors based on the K6 Distress Scale in a national survey (part of a research project on a system for grasping and analyzing statistical information on health status of Japanese people from the perspective of households) supported by a FY2006 Health and Labor Science Research Grant (for research projects on advanced utilization of statistical information).

Figure 23. Changes in the proportion of those scoring 13 or higher on K6

Figure 24. Changes in the proportion of those scoring 13 points or higher on K6, by gender

Figure 25. Proportion of those scoring 13 points or higher on K6 in the FY2020 Survey, by age group

Figure 26. Proportion of those scoring 13 points or higher on K6 in the FY2020 Survey, by location of residence at the time of the survey

#### H. Influence on daily life due to the spread of COVID-19

In the FY2020 survey, those who responded that COVID-19 exerted influence on their daily life "Significantly" or "To some extent" (the affected group) accounted for 42.8% (Figure 27).

By gender, the affected group accounted for 41.9% among males and 43.5% among females (Figure 28). By age group, the affected group accounted for 40.2% among those aged 16 to 39, 44.7% among those aged 40 to 64, and 42.4% among those aged 65 or older (Figure 29). Thus, there were no substantial differences regarding influence on daily life by gender or by age group.

On the other hand, comparing the percentages of those scoring 13 points or higher on K6 between the group of people who were affected by COVID-19 to some extent or significantly and the group of people who were not at all affected or were scarcely affected by COVID-19, the relevant percentage was considerably higher for the former group (Figure 30), showing substantial differences in mental health conditions between these groups.

Figure 27. FY2020: Influence on daily life due to the spread of COVID-19: Overall

Figure 28. FY2020: Influence on daily life due to the spread of COVID-19: By gender

Figure 29. FY2020: Influence on daily life due to the spread of COVID-19: By age group

Figure 30. FY2020: Percentage of those scoring 13 points or higher on K6 by level of influence on daily life due to the spread of COVID-19

## I. Proportion of those judged to be in need of support for trauma reactions caused by the disaster

The intensity of various trauma reactions (various symptoms of post-traumatic stress disorder [PTSD]) in the disaster-affected population was measured using PCL.

In the FY2014 and FY2015 surveys, PCL questions were omitted in order to reduce the burden on respondents. Thereafter, a simplified 4-item questionnaire (PCL-4) was developed and its credibility and validity were verified. Accordingly, since FY2016, the survey of levels of traumatic reactions was resumed using this simplified questionnaire. Based on prior studies, the cutoff value for screening those with the possibility of PTSD is 44 for the original PCL and 12 for newly adopted PCL-4. For this reason, results for FY2011 to FY2013 and the results for FY2016 onward cannot be directly compared.

In the FY2020 Survey, the proportion of those with high-risk scores (PCL-4 score of 12 or more) was 8.4%, which was lower than the results from FY2016 to FY2018, the first survey years to use PCL-4 (Figure 31). The comparison by gender shows that the percentage has been higher among females than among males in any given year (Figure 32). This trend is consistent with many prior studies.

Figure 33 shows a comparison by age group. The proportion of those with high-risk scores increased with age. This result is consistent with previous studies. Figure 34 shows a comparison by residential location at the time of the survey (in or outside Fukushima prefecture). As indicated by the results of many other comparative studies, the proportion of those with high-risk scores is higher among those living outside the prefecture than among those living in the prefecture.

[About PCL-4]

PCL-4 consists of 4 questions asking how frequently the respondent experienced trauma reactions due to disaster experience, such as recalling or trying to avoid unwanted memories or feeling highly nervous, during the past 30 days. A score of 12 points or higher is considered to indicate possible PTSD.

Figure 32. Changes in proportion of adults in need of support for traumatic reactions, by gender

Figure 33. Traumatic reactions in adults (based on PCL-4) in the FY2020 Survey: Proportion of those in need of support, by age group

Figure 34. Traumatic reactions in adults (based on PCL-4) in the FY2020 Survey: Proportion of those in need of support, by location of residence at the time of the survey

## J. Risk perception of health effects of radiation

To assess risk perception, this survey solicited beliefs about possible health effects of radiation. Regarding long-term effects of radiation (late effects), 27.4% of the respondents to the FY2020 survey responded that they think late effects are likely to occur ("Possibilities are high" and "Possibilities are very high" combined). The proportion gradually decreased from 48.1% in FY2011 to 31.4% in FY2014. It remained almost unchanged for the following five years, followed by a trend to decrease in the most recent 2 years. (Figure 35)

Regarding effects on the next generation, 27.2% responded that they think effects on the next generation are likely to occur ("Possibilities are high" and "Possibilities are very high" combined) in the FY2020 survey. The proportion gradually decreased from 60.2% in FY2011 to 38.0% in FY2014, in the same manner as the responses concerning long-term radiation effects. It remained almost unchanged for the following five years but decreased in FY2019 and FY2020. (Figure 36)

In a comparison by residential location at the time of the survey (FY2020 / in or outside the prefecture), risk perception was higher among those living outside the prefecture for both late effects and effects on the next generation than those living in the prefecture. (Figures 37 and 38)

\* The proportion of those who responded "Possibilities are very low" or "Possibilities are very high" decreased substantially in FY2017–FY2020 surveys, compared to the percentages in FY2016 survey. This may be due in whole or part to changes in the questionnaire (see p. 50).

Figure 35. Changes in risk perception of radiation effects (late effects)

		□Possibilities a ■Possibilities a	re very low re high		⊡Possibilities a ■Possibilities a	re low re very high	
2011	15.2	24.6		25.3		34.9

Figure 38. Risk perception of radiation effects (next-generation effects) in FY2020 Survey, by location of residence at the time of the survey

## K. Availability of consultation resources

Figure 39 shows the distribution of responses to the question on availability of consultation resources: "Do you know anyone or any organization you can consult with when you have physical or mental problems?" A total of 31,121 (89.4%) answered "Yes," while 3,672 (10.6%) answered "No."

# Figure 39. Fy2020 Consultation resources for physical and mental problems of adults (multiple responses)

#### (3) Conclusions

Regarding eligible children (up to junior high school students), exercise habits are improving for children aged 2 to 3 and 4 to 6, but improvements have not been observed for elementary and junior high school students. The percentage of high-risk children based on parents' assessment of their emotions and behavior (SDQ) has improved to a level approaching national standards, but it should be noted that the number of survey-eligibale children without disaster experience is increasing.

Regarding adults (aged 16 or older), their subjective sense of well-being is improving constantly, but elderly people's subjective sense of well-being was generally worse. Sufficiency of sleep and frequency of exercise are also improving moderately, but those living outside the prefecture tended to exercise slightly less frequently than those living in the prefecture. The percentages of smokers and those having problematic drinking behaviors are decreasing for both males and females. Among males, the percentage of those having problematic drinking behaviors is high for those aged 40 to 64, and among females, the relevant percentage tends to be higher for younger people.

Adults' mental health conditions have improved significantly compared with the results of the first survey, but the improvement has become slow in recent years and their K6 scores have remained higher than national standards. In particular, it is of concern that K6 scores of those aged 16 to 39 have continually been significantly higher. When compared by residential location at the time of the survey, mental health conditions were generally worse for those living outside the prefecture.

Regarding the influence on daily life due to the spread of COVID-19, other various surveys and studies have suggested the possibility of significant influence on people's lifestyles, including their mental health. It was found that among children (up to junior high school students), the older they are, the larger the influence. In contrast, more than half of the adult respondents answered that they were "Not at all" affected or were "Scarcely" affected, which suggests that many coped with COVID-19 better than had been expected. However, the percentage of those with high-risk scores (K6 score of 13 points or higher) was much higher among respondents who answered that they were affected than among respondents who answered that they mere affected than among respondents who answered that they mere affected than among respondents on people's mental health.

#### 4. Outline of Post-Survey Support

As part of the Mental Health and Lifestyle Survey, we fed back individual results that can be useful to residents for their better health management and provided support to those who were judged to needed counseling or support regarding their mental health or lifestyle habits, with the aim of ascertaining their circumstances, providing advice for improvements, and connecting them to health or medical facilities.

#### (1) Coverage of support

Out of those who responded to the FY2020 Mental Health and Lifestyle Survey, those who were judged to be needed counseling or support by telephone or mail were covered as support candidates.

Tabulation in this report covers those who responded by October 31, 2021, and to whom we provided support by December 31, 2021.

#### (2) Individual result report

Individual result reports were sent in September and October 2021 to those who responded by August 31, 2021, to help guide their understanding of mental health and lifestyle issues and better manage their own health.

#### Table 2. Number of individual result reports sent out

Type of survey sheet	Number of notices sent	Contents
For children aged 0 - 3	371	Height, weight, dietary habits (children aged 1 or older), fitness habits(children aged 2 or older), and bedtime
For children aged 4 - 6	446	
For elementary school students	1,272	Height, weight, dietary habits, fitness habits, bedtime, and mental and behavioral stress reaction (SDQ score)*1
For junior high school students	691	
For adults	35,572	Body Mass index(BMI)*2, dietary habits, fitness habits, sleep, and mental stress reaction (K6 score)*3

\*1 Strength and Difficulties Questionnaire; mental health and behavioral screening scale for children

\*2 Body Mass Index (calculated based on height and weight written in the survey forms)

\*3 Psychological distress scale which screens for general mental illness, such as depression and anxiety In result reports for children, standard height and weight by age in months as of the day of filling in the survey form were provided for reference.]

## (3) Criteria to identify those in need of support and methods of providing support

A. Criteria to assess the need for support

In accordance with the level of significance and urgency, the following criteria were set to identify those in need of support (Tables 3 and 4)

### Table 3. Criteria to assess the need for support regarding issues for children

		Moods and behavior (SDQ)	Whether or not having any person or organization to consult with, problems concerning growth, problems concerning school attendance	Free comment
		1) SDQ: 20 or over	1) Having worries concerning growth, and having no person or organization to consult with	
		2) SDQ: 16 or over, and	2) Having PTSD or depression	
ia	Criteria I	- No person or organization to consult with, and	3) Having been absent from school for 30 days or more, and having no person or organization to consult with; or having been absent from school for 30 days or more and having never consulted with a professional body	
ction crite		- Absent from school for 30 days or more	4) Children aged 4 to 6 who have ever been absent from kindergarten or nursery school and have no person or organization to consult with	The urgency level should be judged by
Selec	Criteria II	3) SDQ: 16 or over	<ul> <li>5) Having worries concerning growth but having never consulted with a professional body</li> <li>6) Having been absent from school for less than 30 days, and having no person or organization to consult with, or having never consulted with a professional body</li> <li>7) Children aged 4 to 6 who have ever been absent from kindergarten or nursery school and have never consulted with a professional body</li> </ul>	an oxyert.

		Mental health	Medical control	Sleep disorder	Mental disorder	Smoking and drinking	Free comment
	Criteria I	1) K6: 13 or over	<ol> <li>With hypertension or diabetes but not seeing a physician, and (i) with BMI of 27.5 or over and (ii) taking at least 66g of alcohol per day on average</li> <li>Taking at least 66g of alcohol per day on average and with CAGE score of 4</li> </ol>				The urgency level should be judged by an expert.
Selection criteria	eria II	2) K6: 10 or over	3) Falling under 1) above, but (i) and (ii) are not applicable	Having no mental disorder, being rather or very unsatisfied with sleep, and having experienced	Having mental disorder, but not seeing a physician, or making no reply to the relevant	1) Taking at least 66g of alcohol per day on average and with a CAGE score of 2 or 3	
	Crite	3) PCL-4: 12 or over	4) Other than 1) and 2) above, with a weight increase of 3kg or more per year and BMI of 27.5 or over	depression of reduced activity during the day	question		
	Criteria III		5) Other than 1) and 2) above, with a weight increase of 3kg or more per year and BMI of 25.0 or over but lower than 27.5			2) Among other criteria, with a CAGE score of 2 or over or the Brinkman Index of 200 or over	

#### Table 4. Criteria to assess the need for support regarding personal issues for adults

\* Smoking cessation calls for those who meet the support criteria and have a Brinkmann index of 200 or higher.

#### B. Methods of providing support

### (i) Support for those meeting Criteria I

For those who met Criteria I, our Mental Health Support Team, consisting of clinical psychologists, public health nurses, clinical nurses, etc., made phone calls and provided counseling. The team asked about support recipients' health conditions, assessed current problems, and advised further examination at health/medical facilities when necessary (hereafter "telephone counseling").

#### (ii) Support for those meeting Criteria II

For those who met Criteria II, we sent reply-paid postcards to confirm their intention of whether or not to receive telephone counseling. Telephone counseling was provided to either those who expressed their intention to receive support or those who were judged to be needed support based on the content of their replies. For those who have any problems pertaining to medical control, sleep, or drinking habits, we also sent relevant informative pamphlets.

#### (iii) Support for those meeting Criteria III

For those who met Criteria III, we sent brochures to help them adopt healthier lifestyles.

## 5. Summary of Results of Post-Survey Support

## (1) Telephone counseling

A. Support for issues concerning children

(A) Number of support candidates and recipients

The numbers of support candidates and recipients based on Criteria I or II are shown in Figure 40. The number of support candidates was 370, or 13.3% of all respondents. Of these, 121 were judged to be in need of telephone counseling, of whom 95 actually received telephone counseling.

Basic attributes of children (based on telephone counseling) are shown in Table 5. By gender, there were 75 boys (62.0%) and 46 girls (38.0%). By location of residence, 92 children (76.0%) were living in the prefecture and 29 children (24.0%) were living outside the prefecture.

### Figure 40. Numbers of support candidates and recipients for issues regarding children

Support Candidates	All	0 - 3	4 - 6	Elementary school children	Junior high school students
(Person)	121	2	15	58	46
Boys	75 (62.0%)	2 (100.0%)	13 (86.7%)	37 (63.8%)	23 (50.0%)
Girls	46 (38.0%)	0 (0.0%)	2 (13.3%)	21 (36.2%)	23 (50.0%)
In the prefecture	92 (76.0%)	2 (100.0%)	15 (100.0%)	47 (81.0%)	28 (60.9%)
Outside the prefecture	29 (24.0%)	0 (0.0%)	0 (0.0%)	11 (19.0%)	18 (39.1%)
Support recipients	95	2	12	49	32

#### Table 5. Basic attributes of children (based on telephone counseling)

\*Residence registration status is as of distribution of the questionnaire for the FY2020 survey

#### (B) Results of the Support

The Mental Health Support Team made phone calls to responders (mostly to the parents or guardians) and asked about current issues, based on survey form the responses. Figure 41 shows the issues identified through telephone counseling from FY2012 to FY2020.

"Anxiety caused by the disaster or radiation and its exposure" was the most frequent in FY2012, but "School life-related matters" has become the most frequent issue in subsequent years.

	FY2012 FY2013 F		FY	2014	FY2015		FY	/2016	FY	2017	FY2018		F	/2019	FY	2020

Support declined	6	(6.3%)	0	(0.0%)	2	(16.7%)	3	(6.1%)	1	(3.1%)

· Continuous support needed:

Those judged as needing continuous support, including those with poor physical conditions, those gravely affected by the disaster or unable to adapt to society or school, and those who have been isolated or have other remaining concerns. Continued support includes recommending consultation with specialists at healthcare/medical facilities and providing their information to other support organizations.

•One time support:

Those judged as being able to take care of themselves as some improvements were seen in their physical conditions or living environment or they were already in contact with support resources.

Details unknown:

No details were obtained for some reason.

Support declined:

Those who turned down the support.

Table 7 shows the reasons for judging that continued support would be necessary after the first telephone support. The major reason was "school maladaptation" for 4 (28.6%), followed by "mental/physical problems" for 2 (14.3%). Reasons for continued support due to the conditions of adult respondents include physical problems for 3 (21.4%) and mental problems for 3 (21.4%)

#### Table 7. Reasons for continued support for issues regarding children

\*Refer below description for the corresponding items in the table

A: Communication with external organizations:

Information was shared with municipalities and the Fukushima Center for Disaster Mental Health, depending on support recipients' circumstances.

B: Sending of relevant documents:

Documents, such as a referral form for seeing a registered physician and a list of physicians, written information on medical facilities and consultation services outside Fukushima, and written personal data to be provided to one's primary care physician, are sent to support recipients

C: Actions by other departments:

Other departments of the Radiation Medical Science Center for the Fukushima Health Management Survey (FHMS) took actions with regard to questions about the Basic Survey and matters concerning the Thyroid Ultrasound Examination
#### **B. Support for adults**

#### (A) Number of support candidates and recipients

Figure 42 shows the numbers of support candidates and recipients based on Criteria I or II and support recipients. The number of support candidates was 6,929, which was 19.3% of all respondents. Of these, the number of those judged to need telephone counseling was 2,443 in total, including those with mental health issues and with lifestyle issues.

Table 10 shows the distribution of support candidates by gender and by age group. Among support candidates for mental health issues, 934 (43.2%) were males and 1,226 (56.8%) were females. Among support candidates for lifestyle issues, 207 (73.1%) were males and 76 (26.9%) were females.

Need continuous support

Those judged as needing continuous support, for reasons of poor physical conditions, gravely affected by the disaster, unable to adapt to society or school, seeming to be isolated, and other remaining concerns. Continuous support includes recommending consultation at healthcare/medical facilities and providing their information to other support organizations.

•One-time support:

Those judged to have some improvements in their physical conditions or living environment, and/or they were already in contact with support resources.

Details unknown: No details were obtained for some reason.

• Declined support: Those who said that they would not need support.

Table 14 shows the reasons for judging that continuous support would be necessary after the first telephone support. The most frequent reason was "mental problems" among 131 (56.7%), followed by "physical problems" among 112 (48.5%).

Number of continued	Ove	rall	Ment	al health	Lifestyle		
support culturates	23	81		227	4

Actions by other departments	0	(0.0%)	0	(0.0%)	0	(0.0%)	

Number of persons / (%)

Communication with external organizations:

Cases where information was shared with municipalities and the Fukushima Center for Disaster Mental Health, depending on support subjects' circumstances

Sending of relevant documents:

Cases where documents, such as a referral form for seeing a registered physician and a list of physicians, written information on medical institutions and consultation services outside Fukushima, and written personal data to be provided to one's primary care physician, are sent to support subjects

Actions by other departments:

Cases where other departments of the Radiation Medical Science Center for the Fukushima Health Management Survey took actions with regard to questions about the Basic Survey and matters concerning the Thyroid Ultrasound Examination

#### (2) Support by sending information brochures

For 3,910 persons who met Criteria III, information brochures were sent to help better manage their health conditions. Brochures on such topics as obesity, drinking problems, and smoking were sent to 347 persons, 1,125 persons, and 2,438 persons, respectively.

# (3) Conclusions

- In the first telephone support for issues regarding children, 14 (14.7%) were judged to need continuous support due to ongoing concerns such as social/school maladaptation or isolation. The most frequent issue was "school life-related issues." The most common type of support provided was "attentive listening," followed by "psychoeducation."
- In the first telephone support for personal issues of adults, 227 (13.0%) were judged to need continuous support due to mental health issues and 4 (1.8%) for lifestyle issues. The most frequent issues were "physical problems" and "sleep problems." The most common type of support was "attentive listening," followed by "guidance on daily habits."
- As a consequence of COVID-19, many answered that they came to have less contact with others as seen in such answers as "Having lost opportunities to see my friends or family members living separately" and "Having lost time for enjoying hobbies, such as park golf," and that troubles among family members increased as a result of being forced to stay home, as seen in such answers as "Increase in time spent together at home caused family members to feel irritated with each other" and "Children got frustrated and had family quarrels often during school's temporary closure."
- For support recipients who were judged to need continued support or who wished to continue receiving support either for their own issues or issues related to their children, our Support Team continued providing telephone support to monitor their conditions and provided them with information on support resources. If the Support Team judged that the urgency was very high, they provided information of support recipients to the recipients' local health/medical facilities. For those to whom the team could not offer telephone support because of absence at the time of the call, etc., we sent a booklet, "Mental Health and Lifestyle Support Book," produced by the Radiation Medical Science Center for the Fukushima Health Management Survey, to encourage them to perform self-checks on their physical and mental health, along with information on various consultation services including our telephone number dedicated to inquiries about the Mental Health and Lifestyle Survey.

# 6. Tabulated Results of the FY2020 Mental Health and Lifestyle Survey (1) Survey for Ages 0–3

Survey for ages 0-3

						Number Per	centage

# Report on the TUE Full-Scale Survey (the fourth-round survey)

As of March 31, 2022

#### 1. Summary

#### 1.1 Purpose

In order to monitor the long-term health of children, we are now engaged in the Full-Scale Survey (fourthround survey), following the Preliminary Baseline Survey for background assessment of thyroid glands, and two Full-Scale Surveys (the second- and third-round surveys) to continuously assess thyroid gland status.

#### **1.2 Eligible Persons**

All Fukushima residents approximately 18 years old or younger at the time of the Great East Japan Earthquake (those born between April 2, 1992 and April 1, 2012).

#### **1.3 Implementation Period**

FY2018 and FY2019, starting in April 2018:

1.3-1 For those 18 years old or younger

The examination will be carried out on a municipality-by-municipality basis in FY2018 and FY2019.

1.3-2 For those 19-20 years old

The examination will be carried out on an age group basis (i.e., school grade). FY2018: those born in FY1996 and FY1998 FY2019: those born in FY1997 and FY1999

1.3-3 For those 25 years old and older

Those who are older than 20 are recommended to receive the examination every 5 years at the ages of 25, 30, and so on.

FY 2018: those born in FY1993 FY 2019: those born in FY1994 Results of the survey for those 25 years old will be reported separately.

**1.4 Implementing Organizations** (Number of medical facilities with agreements for implementation of thyroid examinations as of March 31, 2022)

Fukushima Prefecture commissioned Fukushima Medical University (FMU) to conduct the survey in cooperation with organizations inside and outside Fukushima for the convenience of participants.

1.4-1 Primary examination facilities	
In Fukushima Prefecture	83 medical facilities
Outside Fukushima Prefecture	129 medical facilities

1.4-2 Confirmatory examination facilities								
In Fukushima Prefecture	5 medical facilities, including FMU							
Outside Fukushima Prefecture	37 medical facilities							

#### 1.5 Method

1.5-1 Primary examination Ultrasonography of the thyroid gland Assessments are made by specialists on the basis of the following criteria: - Grade A

A1: No nodules/cysts

A2: Nodules  $\leq$  5.0 mm and/or cysts  $\leq$  20.0 mm

- Grade B

Nodules  $\geq$  5.1 mm and/or cysts  $\geq$  20.1 mm

Some A2 results may be re-classified as B results when clinically indicated.

- Grade C

Immediate need for confirmatory examination, judging from the condition of the thyroid gland.

1.5-2 Confirmatory examination

Ultrasonography of the thyroid gland, blood test, urine test, and fine needle aspiration cytology (FNAC) if needed for those with Grade B or C results.

Priority is given to those in urgent clinical need. A medical follow-up may be recommended based on confirmatory examination results.

#### 1.5-3 Flow chart

Fig.1 Flow chart

#### **1.6 Municipalities Surveyed**

The municipalities where examinations (for those 18 years old or younger) were carried out in FY2018 and FY2019 are as follows:

Fig.2 Municipalities surveyed in FY2018 and FY2019

Note: Primary examinations scheduled in March 2020 at elementary and junior high schools in Iwaki City, but postponed due to the COVID-19 pandemic, were conducted in September and October of 2020.

#### 2. Results as of March 31, 2022

#### 2.1 Results of the Primary Examination

2.1-1 Implementation status

The examination was carried out for 183,407 (62.3%) participants by March 31, 2022

(Implementation status for each municipality and prefectures other than Fukushima are shown in Appendix 1 and Appendix 2).

Results of 183,398 participants (100.0%) have been finalized and individual result reports were already sent to them. (Result for each municipality are shown in Appendix 3).

Of these, 61,708 (33.6%) had Grade A1 results; 120,298 (65.6%) were Grade A2; 1,392 (0.8%) were Grade B; none were Grade C.

	Fligible	Participants (%)			Participants with finalized results (%)

FY2018	107,994	701	(0.6)	368	(0.3)	4	(0.0)	70,754	(65.5)	
FY2019	75,404	686	(0.9)	300	(0.4)	1	(0.0)	50,245	(66.6)	
Total	183,398	1,387	(0.8)	668	(0.4)	5	(0.0)	120,999	(66.0)	

• Percentages are rounded to a lower decimal place. This applies to other tables as well.

• Those born between FY1992 and FY1995 are excluded as they are eligible for the Age 25 Survey. Results for Age 25 Survey participants will be reported separately.

• Age 25 Survey for those born in FY1992 (approx. 23,000), FY1993 (approx. 22,000), FY1994 (approx. 22,000), and FY1995 (approx. 21,000) took place in FY2017, FY2018, FY2019, and FY2020, respectively.

#### 2.1-2 Participation rates by age group

The participation rate for each age group as of April 1 of each year is shown in Table 3.

Table 3 Participation rates by age group

			Total		Age group	
	Age group*			6-11	12-17	18-24

	Participation rate (%)	(b/a)	62.3	87.6	82.0	12.8

• Age groups are based on age as of April 1 of each fiscal year.

2.1-3 Comparison of the third- and fourth-round survey results

Comparison of results of two Full-Scale Survey (third- and fourth-round surveys) is shown in Table 4.

Among 163,674 participants with Grade A1 or A2 results in the third-round survey, 162,995 (99.6%) had Grade A1 or A2 results, and 679 (0.4%) had Grade B results in the fourth-round survey.

Among 731 participants Grade B results in the third-round survey, 148 (20.2%) had Grade A1 or A2 results, and 583 (79.8%) had Grade B results in the fourth-round survey.

#### 2.2 Results of the Confirmatory Examination

#### 2.2-1 Implementation status

r

By March 31, 2022, 1,036 (74.4%) of 1,392 people have received the examination. Of those, 1,013 (97.8%) had completed the entire process of the confirmatory examination. (Progress and results of the confirmatory examination are shown in Table 5.)

Of the aforementioned 1,013 participants, 94 (9.3%) were confirmed to meet Grade A diagnostic criteria by the primary examination standards (A1: 6, A2: 88) (including those with other thyroid conditions).

The remaining 919 (90.7%) were confirmed to be outside of A1/A2 criteria.

Table 5 Progress and results of the confirmatory examination

2.2-2 Results of fine needle aspiration cytology (FNAC)

Among those who underwent FNAC, 39 had nodules classified as malignant or suspicious for malignancy: 17 of them were male, and 22 were female.

Participants' age at the time of the confirmatory examination ranged from 9 to 24 years (mean age:  $17.0 \pm 3.1$  years). The minimum and maximum tumor diameters were 6.1 mm and 29.4 mm. Mean tumor diameter was  $13.1 \pm 6.3$  mm.

Of these 39 participants, 26 had Grade A results (A1: 6, A2: 20) and 9 had Grade B results in the third-round survey. The remaining 4 people did not participate in the third-round survey.

\* Appendix 6 shows surgery cases.

2.2-3 Age distribution of malignant or suspected malignant cases diagnosed by FNAC

Age distributions of 39 people with malignant or suspected malignant nodules based on their age as of March 11, 2011 is per Fig. 3, and age distribution based on their age at the time of confirmatory examination is per Fig. 4.

Note: Those aged between 15 and 18 at the time of the disaster are not included in the fourth-round survey participants.

The horizontal axis begins at -1 to include those born between April 2, 2011, and April 1, 2012. \*Those born between March 12 and April 1, 2011, are included as age 0.

Fig.4 Age as of the date of confirmatory examination

2.2-4 Basic Survey results of those with malignant or suspicious nodules by FNAC

Of the 39 people with malignant or suspicious nodules, 19 people (48.7%) had participated in the Basic Survey (for external radiation dose estimation), and all 19 received their results. The highest effective dose documented was 2.4 mSv.

Effective				Age	e at the time	the time of the disaster

#### Table 9 Urinary iodine test results

 $(\mu g/day)$ 25th percentile Median 75th percentile Maximum Minimum Malignant or 39 35 93 189 415 1,783 suspicious: Other: 921 32 119 192 345 31,920

1) FT4: free thyroxine, thyroid hormone binding 4 iodines; higher among patients with thyrotoxicosis (such as Graves' disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).

FT3: free triiodothyronine, thyroid hormone binding 3 iodines; higher among patients with thyrotoxicosis (such as Graves' 2) disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).

3) TSH: thyroid-stimulating hormone; higher among patients with Hashimoto's disease and lower with Graves' disease.

Tg: thyroglobulin; higher when thyroid tissue is destroyed or when neoplastic tissue produces thyroglobulin. 4)

TgAb: anti-thyroglobulin antibody; higher among patients with Hashimoto's disease and Graves' disease. 5)

TPOAb: anti-thyroid peroxidase antibody; higher among patients with Hashimoto's disease or Graves' disease. 6)

Reference interval varies according to age. 7)

#### 2.2-6 Confirmatory examination results by area

The percentages of those with malignant or suspicious nodules were 0.03% in Hamadori and 0.02%in Nakadori and Aizu, versus 0.01% in the 13 municipalities of the nationally-designated evacuation zone.

#### 3. Mental Health Care

We provide the following support for thyroid examination participants.

#### **3.1 Support for Primary Examination Participants**

After the examination, medical doctors offer person-to-person explanation of examination results, showing the ultrasound images in private consultation booths at examination venues set up in public facilities.

Consultation booths were set up at all venues for examinations conducted in and after April 2018; as of March 31, 2022, all 2,654 (100%) of 2,655 participants had visited these consultation booths.

#### 3.2 On-location Lectures and Information Sessions

To help participants or their parents/guardians improve their understanding of the thyroid examination, we have conducted on-location lectures and information sessions since April 2018.

By March 31, 2020, a total of 1,063 people had participated in these sessions, offered at 32 locations.

#### 3.3 Support for Confirmatory Examination Participants

A support team has been set up within Fukushima Medical University to offer psychological support to address any anxieties and concerns of confirmatory examination participants during examination. The team also answers questions and offers counseling via our website.

Since the start of the fourth-round survey, 483 participants (163 males and 320 females) have received support as of March 31, 2022. The number of support sessions provided was 959 in total. Of these, 480 (50.1%) received support at the participants' first examination and 479 (49.9%) at subsequent examinations.

For those who proceeded to regular insured medical care, the support team continues to provide support in cooperation with teams of medical staff at hospitals.

# Report on the TUE Full-Scale Survey (fifth-round survey)

As of March 31, 2022

# 1. Summary

### 1.1 Purpose

In order to monitor the long-term health of children, we are now engaged in the Full-Scale Survey (fifth-round survey), following the Preliminary Baseline Survey for background assessment of thyroid glands, and three Full-Scale Surveys (second-, third-, and fourth-round surveys) to continuously assess the status of thyroid glands.

# 1.2 Eligible persons

All Fukushima residents approximately 18 years old or younger at the time of earthquake (those born between April 2, 1992 and April 1, 2012).

# **1.3 Implementation Period**

FY2020 and FY2022, starting in April 2020:

1.3-1 For those 18 years old or younger

The examination will be carried out over 3 years, from FY2020 through FY2022.

1.3-2 For those 19 years old or older

The examination will be carried out on an age group basis (i.e., school grade). FY2020: those born in FY1998 and FY2000 FY2021: those born in FY1999 and FY2001 FY2022: no eligible persons

1.3-3 For those 25 years old or older

Those who are older than 20 are recommended to receive the examination every 5 years at the ages of 25, 30, and so on.

FY2020: those born in FY1995FY2021: those born in FY1996FY2022: those born in FY1997Results of the survey for those 25 years old will be reported separately.

**1.4 Implementing Organizations** (Number of medical facilities with agreements for implementation of thyroid examinations as of March 31, 2022)

Fukushima Prefecture commissioned Fukushima Medical University (FMU) to conduct the survey in cooperation with organizations inside and outside Fukushima for the convenience of participants (the number of medical facilities shown below is as of March 31, 2021).

1.4-1 Primary examination facilities	
Inside Fukushima Prefecture	83 medical facilities
Outside Fukushima Prefecture	129 medical facilities

1.4-2 Confirmatory examination facilities									
Inside Fukushima Prefecture	5 medical facilities including FMU								
Outside Fukushima Prefecture	37 medical facilities								

# 1.5 Methods

1.5-1 Primary examinationUltrasonography of the thyroid glandAssessments are made by specialists on the basis of the following criteria:- Grade A

# A1: No nodules/cysts

A2: Nodules  $\leq$  5.0 mm or cysts  $\leq$  20.0 mm

- Grade B

B: Nodules  $\geq$  5.1 mm or cysts  $\geq$  20.1 mm

Some A2 results may be re-classified as B results when clinically indicated.

-Grade C

C: Immediate need for confirmatory examination, judging from the condition of the thyroid gland.

1.5-2 Confirmatory examination

Ultrasonography of the thyroid gland, blood test, urine test, and fine needle aspiration cytology (FNAC) if needed for those with B or C test results.

Priority is given to those in urgent clinical need. A medical follow-up may be recommended based on confirmatory exam results.

# **1.6 Municipalities Surveyed**

The municipalities where examinations (for those 18 years old or younger) were carried out in FY2020 and FY2021 are as follows:

Fig. 2 Municipalities covered for primary examinations at elementary and junior high schools

Fig. 3 Municipalities covered for primary examinations at high schools and other facilities

Results of these surveys were aggregated based on the year when examinations were originally scheduled, which may differ from the year in which some examinations were actually conducted.

#### 2. Results as of March 31, 2022

#### 2.1 Results of the Primary Examination

2.1-1 Implementation status

The primary examination was carried out for 74,964 participants (29.6%) by March 31, 2022.

Results of 69,822 participants (93.1%) have been finalized and individual result reports were already sent to them.

Of these, 20,481 (29.3%) had Grade A1 results; 48,472 (69.4%) were Grade A2; 869 (1.2%) were Grade B; none were Grade C.

Table 1 Progress and results of the primary examination

	Eligible	Participants (%)			Participants with finalized results (%)									
	persons Outside the prefecture			A		Those referred to confirmatory exam								
				prefecture				A1	A2		В		C	
	а	b	(b/a)		с	(c/b)	d	(d/c)	е	(e/c)	f	(f/c)	g	(g/c)

Total	252,902	74,96	64 (29.6)	7,214	69,82	2 (93.1)	20,48	1 (29.3)	48,47	2 (69.4)	86	9 (1.2)	(	0.0)

# Table 2 Number and proportion of participants with nodules/cysts (See Appendix 1 for more details)

	Participants	Participants with nodules/cysts (%)									
	with finalized	Nod	ules	Cysts							
	results	≥5.1mm	≤ 5.0mm	≥20.1mm	≤ 20.0mm						
	а	b (b/a)	c (c/a)	d (d/a)	e (e/a)						
FY2020	60,615	647 (1.1)	332 (0.5)	1 (0.0)	42,707 (70.5)						
FY2021	9,207	222 (2.4)	87 (0.9)	0 (0.0)	6,253 (67.9)						
Total	69,822	869 (1.2)	419 (0.6)	1 (0.0)	48,960 (70.1)						

• Proportions are rounded to a lower decimal place. This applies to other tables as well.

• Those who receive the examination at 5-year intervals (born between FY1992 and FY1997) are excluded. The results of examinations with 5-year intervals will be shown separately.

• Examinations for those born in FY1992 (approx. 23,000), FY1993 (approx. 22,000), FY1994 (approx. 22,000), FY1995 (approx. 21,000) took place in FY2017, FY2018, FY2019, and FY2020, respectively. Examinations for those born in FY1996 (approx. 21,000) and FY1997 (approx. 20,000) will be carried out in FY2021 and FY2022, respectively.

# 2.1-2 Participation rate by age group

The participation rate for each age group as of April 1 of each year is shown in Table 3.

			Total		Age group				
	Age group*			8-11	12-17	18-24

# 2.1-3 Comparison of the fourth- and fifth-round survey results

Comparison of results of two Full-Scale Surveys (fourth- and fifth-round surveys) is shown in Table 4.

Among 64,790 participants with Grade A1 or A2 results in the fourth-round survey, 64,320 (99.3%) had Grade A1 or A2 results and 470 (0.7%) had Grade B results in the fifth-round survey.

Among 365 participants with Grade B results in the fourth-round survey, 67 (18.4%) had Grade A1 or A2 results and 298 (81.6%) had Grade B results in the fifth-round survey.

# 2.2 Results of the Confirmatory Examination

#### 2.2-1 Implementation status

By March 31, 2022, 517 (59.5%) of the 869 eligible persons had participated in the confirmatory examination, and 435 (84.1%) of them had completed the entire procedure of the examination.

Of the aforementioned 435 participants, 50 (A1: 4, A2: 46) (11.5%) were confirmed to meet A1 or A2 diagnostic criteria by the primary examination standards (including those with other thyroid conditions) after detailed examination; 385 (88.5%) were confirmed to be outside of A1/A2 criteria.

Table 5 Progress and results of the confirmatory examination

2.2-2 Results of fine needle aspiration cytology (FNAC)

Among those who underwent FNAC, 11 people had nodules classified as malignant or suspicious for malignancy: one of them was male and ten were female.

Participants' age at the time of the confirmatory examination ranged from 13 to 22 (mean age:  $17.6 \pm 2.9$  years). The minimum and maximum tumor diameters were 7.5 mm and 14.7 mm. Mean tumor diameter was  $11.3 \pm 2.6$  mm.

Of these 11 participants, 8 had Grade A (A1:3, A2:5), 2 had Grade B and the results in the previous survey, and the remaining 1 participant did not receive the third-round survey.

#### Table 6 Results of FNAC.

#### Table 8 Urinary iodine test results

						(µg/day)
		Minimum	25th percentile	Median	75th percentile	Maximum
Malignant or suspicious:	11	61	116	175	571	1,311
Other:	392	24	112	187	314	12,670

1) FT4: free thyroxine, thyroid hormone binding 4 iodines; higher among patients with thyrotoxicosis (such as Graves' disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).

- 2) FT3: free triiodothyronine, thyroid hormone binding 3 iodines; higher among patients with thyrotoxicosis (such as Graves' disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).
- 3) TSH: thyroid-stimulating hormone; higher among patients with Hashimoto's disease and lower with Graves' disease.
- 4) Tg: thyroglobulin; higher when thyroid tissue is destroyed or when neoplastic tissue produces thyroglobulin.
- 5) TgAb: anti-thyroglobulin antibody; higher among patients with Hashimoto's disease and Graves' disease.
- 6) TPOAb: anti-thyroid peroxidase antibody; higher among patients with Hashimoto's disease or Graves' disease.
- 7) Reference interval varies according to age.

#### 3. Mental Health Care

We provide the following support for thyroid examination participants.

#### 3.1 Support for Primary Examination Participants

After the examination, medical doctors offer person-to-person explanation on examination results, showing ultrasound images in private consultation booths at examination venues set up in public facilities.

Consultation booths were set up at all venues for examinations conducted in and after April 2020, and as of March 31, 2022, all 2,195 participants (100%) have visited these consultation booths.

#### **3.2 On-location Lectures and Information Sessions**

To help participants and their parents/guardians improve their understanding of the thyroid examination, we have conducted on-location lectures and information sessions since April 2018.

By March 31, 2022, a total of 466 people participated in these sessions offered at 8 locations.

Since the start of these sessions, 15,552 people have participated.

# **3.3 Support for Confirmatory Examination Participants**

A support team has been set up within Fukushima Medical University to offer psychological support to address any anxieties and concerns of confirmatory examination participants during examination. The team also answers questions and offers counseling via our website.

Since the start of the fifth-round survey, 278 participants (95 males and 183 females) have received support as of March 31, 2022. The number of support sessions provided was 471 in total. Of these, 278 (59.0%) received support at the participants' first examination and 193 (41.0%) at subsequent examinations.

For those who proceeded to regular insured medical care, the support team continues to provide support in cooperation with teams of medical staff at hospitals.

#### Report on the TUE Full-Scale Survey (Survey for Age 25+)

As of March 31, 2022

#### 1. Summary

#### 1.1 Eligible Persons

Among Fukushima residents 18 years old or younger at the time of disaster (born between April 2, 1992 and April 1, 2012), those who turn 25 years old during each fiscal year, including those who moved out of the prefecture, are invited to receive a thyroid ultrasound examination (TUE).

Those born in 1996 are also eligible for the Survey for Age 25, but there have been few participants. Therefore, this report includes the status of the following groups:

- Those born in FY1992 (between April 2, 1992 and April 1, 1993)
- Those born in FY1993 (between April 2, 1993 and April 1, 1994)
- Those born in FY1994 (between April 2, 1994 and April 1, 1995)
- Those born in FY1995 (between April 2, 1995 and April 1, 1996)
- Those born in FY1996 (between April 2, 1996 and April 1, 1997) For those born in FY1996, this report presents only the primary examination results as the number of examinations conducted is limited.

#### **1.2 Implementation Period**

The Survey for Age 25+ (hereinafter "Age 25+ Survey") started in FY2017 for those who turn 25 years old during each fiscal year. If residents cannot receive the examination in the year they turn 25, they are entitled to one any time through the fiscal year prior to the year they turn 30 (see Fig. 1 for the implementation schedule of Age 25+ Survey).

• Beginning in FY2017, examinations are offered to those who turn age 25 in each fiscal year.

• Invitations for the examination will be sent to those who turn age 25 in the fiscal year marked with  $\star$ .

Fig. 1 Implementation schedule for Age 25+ Survey

# 2. Overview age 25+ survey results (as of March 31, 2022)

### 2.1 Results of the Primary Examination

#### 2.1-1 Implementation status

Primary examinations for the Age 25 Survey started in May 2017 for those who turned 25 years old in FY2017 (those born between FY1992 and FY1996), of whom 9,841 (9.1%) participated (Implementation status by area and implementation status outside Fukushima Prefecture are shown in Appendix 1 and Appendix 2, respectively).

Results of 9,520 (96.7%) participants have been finalized and individual results reports have already been sent to them. (Refer to Appendix 3 for the results by municipalities)

Of these, 4,043 (42.5%) had Grade A1 results; 4,973 (52.2%) were Grade A2; 504 (5.3%) were Grade B; and none were Grade C.

\* Percentages are rounded to a lower decimal place. This applies to other tables as well.

\*\* The number and results of the Age 25 Survey participants are, and will be, presented by birth year (fiscal year), not by survey year.

#### 2.1-2 Comparison with previous examination results

Comparison of results of the Age 25 Survey and previous surveys is shown in Table 3.

Among 5,682 participants with Grade A1 or A2 results in the previous survey, 5,528 (97.3%) had Grade A1 or A2 results and 154 (2.7%) had Grade B results in the Age 25 Survey.

Among 192 participants with Grade B results in the previous survey, 49 (25.5%) had Grade A (A1 or A2) results and 143 (74.5%) had Grade B results in the Age 25 Survey.

#### 2.2 Results of the Confirmatory Examination

#### 2.2-1 Implementation status

Of 430 eligible persons, 353 (82.1%) participated, of whom 345 (97.7%) completed the entire process of the confirmatory examination.

Of the aforementioned 345 participants, 25 (7.2%) were confirmed to meet Grade A diagnostic criteria by primary examination standards (A1:2, A2:23) (including those with other thyroid conditions). The remaining 320 (92.8%) were confirmed to be outside of A1/A2 criteria.

Table 4 Progress of the Confirmatory Examination

#### 2.2-2 Results of fine needle aspiration cytology (FNAC)

Among those who underwent FNAC, 16 had nodules classified as malignant or suspicious for malignancy: 4 of them were male and 12 were female.

Participants' age at the time of the confirmatory examination ranged from 24 to 27 years (mean age:  $25.4 \pm 0.7$  years). The minimum and maximum tumor diameters were 5.3 mm and 49.9 mm. Mean tumor diameter was  $15.6 \pm 12.1$  mm.

Of these 16 participants, 4 had Grade A2 results and 3 had Grade B results in the previous survey. The remaining 9 people did not participate in the previous survey.

\*Appendix 5 shows surgery cases.

2.2-3 Age distribution of malignant or suspected malignant cases diagnosed by FNAC Age distributions of 16 people with malignant or suspicious nodules based on their age as of March 11, 2011 is per Fig. 2, and age distribution based on their age at the time of confirmatory examination is per Fig. 3.

Note: Those aged -1 through 13 at the time of disaster are not included in the participants of the Age 25 survey for those born in FY1992 through FY1995.

The horizontal axis begins at -1 to include those born between April 2, 2011, and April 1, 2012. \*Those born between March 12 and April 1, 2011, are included as age 0.

Fig.3 Age as of the date of confirmatory examination

2.2-4 Basic Survey results of those with malignant or suspicious nodules by FNAC

Of the 16 people with malignant or suspicious nodules, 9 people (56.3%) had participated in the Basic Survey (for external radiation dose estimation), and all 9 received their results. The highest effective dose documented was 1.9 mSv.

	Effective does	Age at the time of the disaster

# 2.2-5 Blood and urinary iodine test results

Table 7 Blood test results

	FT4 <sup>1)</sup> (ng/dL)	FT3 <sup>2)</sup> (pg/mL)	TSH <sup>3)</sup> (µIU/mL)	Tg <sup>4)</sup> (ng/mL)	TgAb <sup>5)</sup> (IU/mL)	TPOAb <sup>6)</sup> (IU/mL)
Reference Range	0.95-1.74 <sup>7)</sup>	2.13-4.07 <sup>7)</sup>	0.340-3.880 <sup>7)</sup>	≤ 33.7	< 28.0	< 16.0
Malignant or suspicious: 16	1.2±0.1 (6.3%)	3.3±0.5 (12.5%)	1.8±1.8 (18.8%)	42.7±39.3 (50.0%)	6.3%	0.0%
Other: 318	1.2±0.2 (5.0%)	3.2±0.5 (6.9%)	1.1±0.7 (6.9%)	44.2±170.3 (23.6%)	9.1%	9.7%

#### Table 8 Urinary iodine test results

						(µg/day)
		Minimum	25th percentile	Median	75th percentile	Maximum
Malignant or suspicious:	16	73	106	171	280	953
Other:	315	29	118	182	320	11,060

1) FT4: free thyroxine, thyroid hormone binding 4 iodines; higher among patients with thyrotoxicosis (such as Graves' disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).

2) FT3: free triiodothyronine, thyroid hormone binding 3 iodines; higher among patients with thyrotoxicosis (such as Graves' disease) and lower with hypothyroidism (such as Hashimoto's thyroiditis).

3) TSH: thyroid-stimulating hormone; higher among patients with Hashimoto's disease and lower with Graves' disease.

4) Tg: thyroglobulin; higher when thyroid tissue is destroyed or when neoplastic tissue produces thyroglobulin.

5) TgAb: anti-thyroglobulin antibody; higher among patients with Hashimoto's disease and Graves' disease.

6) TPOAb: anti-thyroid peroxidase antibody; higher among patients with Hashimoto's disease or Graves' disease.

7) Reference interval varies according to age.

#### **3 Mental Health Care**

#### 3.1 Support for Primary Examination Participants

Since April 2017, medical doctors offer person-to-person explanations on examination results, showing ultrasound images in private consultation booths at examination venues set up in public facilities. As of March 31, 2022, there were 749 (99.9%) of 750 participants who visited these consultation booths.

#### 3.2 Support for Confirmatory Examination Participants

A support team has been set up within Fukushima Medical University to offer psychological support to address any anxieties and concerns of confirmatory examination participants during examination. The team also answers questions and offers counseling via our website.

Since the start of the Age 25 survey, 102 participants (24 males and 78 females) have received support as of March 31, 2022. The number of support sessions provided was 195 in total. Of these, 102 sessions (52.3%) were offered at the participants' first examination and 93 (47.7%) at subsequent examinations.

For those who proceeded to regular health insurance medical care, the support team continues to provide support in cooperation with teams of medical staff at hospitals.
